Title Analysis of Nonlinear Time Series

Date 2013-04-29

Version 0.1-13.1

Author Antonio, Fabio Di Narzo

Depends R (>= 2.2.0)

Imports deSolve

Suggests scatterplot3d

LazyData yes

LazyLoad yes

Description Routines for the analysis of nonlinear time series. This work is largely inspired by the TISEAN project, by Rainer Hegger, Holger Kantz and Thomas Schreiber:
<<http://www.mpipks-dresden.mpg.de/~tisean/>>.

C2	<i>Sample correlation integral</i>
----	------------------------------------

Description

Sample correlation integral for the specified length scale

Usage

`C2(series, m, d, t, eps)`

Arguments

<code>series</code>	time series
<code>m</code>	embedding dimension
<code>d</code>	time delay
<code>t</code>	Theiler window
<code>eps</code>	length scale

Details

Computes the sample correlation integral on the provided time series for the specified length scale, and considering a time window `t` (see references). It uses a naive algorithm: simply returns the fraction of points pairs nearer than `eps`. Normally, you would use `d2`, which takes roughly the same time, but computes the correlation sum for multiple length scales and embedding dimensions at once.

Value

The sample correlation integral at `eps` length scale.

Author(s)

Antonio, Fabio Di Narzo

See Also

[d2](#)

d2 *Sample correlation integral (at multiple length scales)*

Description

Computes the sample correlation integral over a grid of neps length scales starting from eps.min, and for multiple embedding dimensions

Usage

```
d2(series, m, d, t, eps.min, neps=100)
```

Arguments

series	time series
m	max embedding dimension
d	time delay
t	Theiler window
eps.min	min length scale
neps	number of length scales to evaluate

Details

Computes the sample correlation integral over neps length scales starting from eps.min, for embedding dimension $1, \dots, m$, considering a t time window (see references). The slope of the linear segment in the log-log plot gives an estimate of the correlation dimension (see the example).

Value

Matrix. Column 1: length scales. Column $i=2, \dots, m+1$: sample correlation integral for embedding dimension $i-1$.

Author(s)

Antonio, Fabio Di Narzo

References

Hegger, R., Kantz, H., Schreiber, T., Practical implementation of nonlinear time series methods: The TISEAN package; CHAOS 9, 413-435 (1999)

Examples

```
d2(lorenz.ts, m=6, d=2, t=4, eps.min=2)
```

```
duffing.syst
```

```
Duffing oscillator
```

Description

Duffing oscillator system, to be used with [sim.cont](#)

Details

To be used with [sim.cont](#)

Author(s)

Antonio, Fabio Di Narzo

```
embedd
```

```
Embedding of a time series
```

Description

Embedding of a time series with provided time delay and embedding dimension parameters.

Usage

```
embedd(x, m, d, lags)
```

Arguments

x	time series
m	embedding dimension (if lags missed)
d	time delay (if lags missed)
lags	vector of lags (if m and d are missed)

Details

Embedding of a time series with provided delay and dimension parameters.

Value

Matrix with columns corresponding to lagged time series.

Author(s)

Antonio, Fabio Di Narzo. Multivariate time series patch by Jonathan Shore.

Examples

```
library(scatterplot3d)
x <- window(rossler.ts, start=90)
xyz <- embedd(x, m=3, d=8)
scatterplot3d(xyz, type="l")

## embedding multivariate time series
series <- cbind(seq(1,50),seq(101,150))
head(embedd(series, m=6, d=1))
```

false.nearest	<i>Method of false nearest neighbours</i>
---------------	---

Description

Method of false nearest neighbours to help deciding the optimal embedding dimension

Usage

```
false.nearest(series, m, d, t, rt=10, eps=sd(series)/10)
```

Arguments

series	time series
m	maximum embedding dimension
d	delay parameter
t	Theiler window
rt	escape factor
eps	neighborhood diameter

Details

Method of false nearest neighbours to help deciding the optimal embedding dimension.

Value

Fraction of false neighbors (first row) and total number of neighbors (second row) for each specified embedding dimension (columns)

Author(s)

Antonio, Fabio Di Narzo

Examples

```
(fn.out <- false.nearest(rossler.ts, m=6, d=8, t=180, eps=1, rt=3))
plot(fn.out)
```

lorenz.syst

Lorenz system

Description

Lorenz system, to be used with [sim.cont](#)

Details

To be used with [sim.cont](#)

Author(s)

Antonio, Fabio Di Narzo

lorenz.ts

Lorenz simulated time series, without noise

Description

Lorenz simulated time series, without noise. Of each state of the system, we observe the euclidean norm.

Details

Lorenz simulated time series, without noise, obtained with the call: `lorenz.ts <- sim.cont(lorenz.syst, 0, 100, 0.05, start.x=c(5,5,5), parms=c(10, 28, -8/3), obs.fun = function(x) sqrt(sum(x^2)))`

Author(s)

Antonio, Fabio Di Narzo

Lyapunov exponent *Tools to evaluate the maximal Lyapunov exponent of a dynamic system*

Description

Tools to evaluate the maximal Lyapunov exponent of a dynamic system from a univariate time series

Usage

```
lyap_k(series, m, d, t, k=1, ref, s, eps)
lyap(dsts, start, end)
```

Arguments

series	time series
m	embedding dimension
d	time delay
k	number of considered neighbours
eps	radius where to find nearest neighbours
s	iterations along which follow the neighbours of each point
ref	number of points to take into account
t	Theiler window
dsts	Should be the output of a call to lyap_k (see the example)
start	Starting time of the linear bite of dsts
end	Ending time of the linear bite of dsts

Details

The function lyap_k estimates the largest Lyapunov exponent of a given scalar time series using the algorithm of Kantz.

The function lyap computes the regression coefficients of a user specified segment of the sequence given as input.

Value

lyap_k gives the logarithm of the stretching factor in time.

lyap gives the regression coefficients of the specified input sequence.

Author(s)

Antonio, Fabio Di Narzo

See Also

`mutual`, `false.nearest` for the choice of optimal embedding parameters. `embedd` to perform embedding.

Examples

```
output <-lyap_k(lorenz.ts, m=3, d=2, s=200, t=40, ref=1700, k=2, eps=4)
plot(output)
lyap(output, 0.73, 2.47)
```

mutual	<i>Average Mutual Information</i>
--------	-----------------------------------

Description

Estimates the average mutual information index (ami) of a given time series for a specified number of lags

Usage

```
mutual(series, partitions = 16, lag.max = 20, plot=TRUE, ...)
```

Arguments

series	time series
partitions	number of bins
lag.max	largest lag
plot	logical. If 'TRUE' (the default) the ami is plotted
...	further arguments to be passed to the plot method

Details

Estimates the mutual information index for a specified number of lags. The joint probability distribution function is estimated with a simple bi-dimensional density histogram.

Value

An object of class "ami", which is a vector containing the estimated mutual information index for each lag between 0 and lag.max.

Author(s)

Antonio, Fabio Di Narzo

References

Hegger, R., Kantz, H., Schreiber, T., Practical implementation of nonlinear time series methods: The TISEAN package; CHAOS 9, 413-435 (1999)

Examples

```
mutual(lorenz.ts)
```

plot.ami

Plotting average mutual information index

Description

Plotting method for objects inheriting from class "ami".

Usage

```
## S3 method for class 'ami'  
plot(x, main = NULL, ...)
```

Arguments

x "ami" object
main, ... additional graphical arguments

Details

Plots the ami for each lag in x.

Author(s)

Antonio, Fabio Di Narzo

See Also

[mutual](#)

plot.d2 *Plotting sample correlation integrals*

Description

Plotting method for objects inheriting from class "d2".

Usage

```
## S3 method for class 'd2'  
plot(x, ...)
```

Arguments

x "d2" object
... additional graphical arguments

Details

Plots the sample correlation integrals in x in log-log scale, as a line for each considered embedding dimension.

Author(s)

Antonio, Fabio Di Narzo

See Also

[d2](#)

plot.false.nearest *Plotting false nearest neighbours results*

Description

Plotting method for objects inheriting from class "false.nearest".

Usage

```
## S3 method for class 'false.nearest'  
plot(x, ...)
```

Arguments

x "false.nearest" object
... additional graphical arguments

Details

Plots the results of [false.nearest](#).

Author(s)

Antonio, Fabio Di Narzo

See Also

[false.nearest](#)

print.d2

Printing sample correlation integrals

Description

Printing method for objects inheriting from class `"d2"`.

Usage

```
## S3 method for class 'd2'  
print(x, ...)
```

Arguments

x	"d2" object
...	additional arguments to 'print'

Details

Simply calls [plot.d2](#).

Author(s)

Antonio, Fabio Di Narzo

See Also

[plot.d2](#), [d2](#)

`print.false.nearest` *Printing false nearest neighbours results*

Description

Printing method for objects inheriting from class `"false.nearest"`.

Usage

```
## S3 method for class 'false.nearest'  
print(x, ...)
```

Arguments

<code>x</code>	<code>"false.nearest"</code> object
<code>...</code>	additional arguments to <code>'print'</code>

Details

Prints the table of results of `false.nearest`.

Author(s)

Antonio, Fabio Di Narzo

See Also

`plot.false.nearest`, `false.nearest`

`recurr` *Recurrence plot*

Description

Recurrence plot

Usage

```
recurr(series, m, d, start.time=start(series), end.time=end(series), ...)
```

Arguments

series	time series
m	embedding dimension
d	time delay
start.time	starting time window (in time units)
end.time	ending time window (in time units)
...	further parameters to be passed to filled.contour

Details

Produces the recurrence plot, as proposed by Eckmann et al. (1987). White is maximum distance, black is minimum.

warning

Be aware that number of distances to store goes as n^2 , where $n = \text{length}(\text{window}(\text{series}, \text{start}=\text{start.time}, \text{end}=\text{end.time}))$!

Examples

```
recurr(lorenz.ts, m=3, d=2, start.time=15, end.time=20)
```

rossler.syst

Roessler system of equations

Description

Roessler system of equations

Details

To be used with [sim.cont.](#)

Author(s)

Antonio, Fabio Di Narzo

rossler.ts	<i>Roessler simulated time series, without noise</i>
------------	--

Description

Roessler simulated time series, without noise. Of each state of the system, we observe the first component.

Details

Roessler simulated time series, without noise, obtained with the call:

```
rossler.ts <- sim.cont(rossler.syst, start=0, end=650, dt=0.1, start.x=c(0,0,0), parms=c(0.15, 0.2, 10))
```

Author(s)

Antonio, Fabio Di Narzo

sim.cont	<i>Simulates a continuous dynamic system</i>
----------	--

Description

Simulates a dynamic system of provided ODEs

Usage

```
sim.cont(syst, start.time, end.time, dt, start.x, parms=NULL, obs.fun=function(x) x[1])
```

Arguments

syst	ODE system
start.time	starting time
end.time	ending time
dt	time between observations
start.x	initial conditions
parms	parameters for the system
obs.fun	observed function of the state

Details

Simulates a dynamic system of provided ODEs. Uses lsoda in odesolve for numerical integration of the system.

Value

The time series of the observed function of the system's state

Author(s)

Antonio, Fabio Di Narzo

See Also

[lorenz.syst](#), [rossler.syst](#), [duffing.syst](#)

Examples

```
rossler.ts <- sim.cont(rossler.syst, start=0, end=650, dt=0.1,
                      start.x=c(0,0,0), parms=c(0.15, 0.2, 10))
```

stplot

Space-time separation plot

Description

Space-time separation plot

Usage

```
stplot(series, m, d, idt=1, mdt)
```

Arguments

series	time series
m	embedding dimension
d	time delay
idt	observation steps in each iteration
mdt	number of iterations

Details

Produces the space-time separation plot, as introduced by Provenzale et al. (1992), which can be used to decide the Theiler time window t , which is required in many other algorithms in this package.

It plots the probability that two points in the reconstructed phase-space have distance smaller than epsilon in function of epsilon and of the time t between the points, as iso-lines at levels 10%, 20%, ..., 100%.

Value

lines of constant probability at 10%, 20%, ..., 100%.
